

Dev AI Bootcamp — Workbook (Dev track) v2.0

Companion to: Program and the common workbook

Role focus: Developer

Common core: same delegation, governance, telemetry, capstone, and viva rules. This file changes the practice artifacts toward working code.

Terminology: For unified terminology, see `docs/GLOSSARY.md`.

o. Shared case study

Use the LMS case or one project brief as the role-specific coding scenario.

The developer objective is not "AI wrote code fast". The objective is "I can review, test, debug, and control AI-generated code responsibly."

Common rules

- Treat AI-generated code like a PR from a fast but unreliable teammate.
 - Every code exercise must include review evidence.
 - Fake tests are a failure mode, not a pass.
 - Telemetry and Dev Book logging are mandatory.
-

DEV-EX-01 — Generate code from spec + review AI code

Goal: create code from a spec and prove human review happened.

Outputs:

- generated code sample
- review comments or corrected code
- telemetry

Pass bar: the learner catches at least one functional, structural, or safety issue in the AI-generated code.

DEV-EX-02 — Test generation + fake-test detection

Goal: generate tests and prove they are not superficial.

Outputs:

- test suite
- at least one intentionally broken case
- explanation of why a fake-green test is unacceptable
- telemetry

Pass bar: the learner demonstrates that tests fail when they should fail.

DEV-EX-03 — Debug with AI

Goal: use AI to accelerate debugging without losing human reasoning.

Outputs:

- reproduction steps
- root-cause note
- fix
- telemetry

Pass bar: the learner can explain the bug, not just present the patch.

DEV-EX-04 — Build a small harness / agent

Goal: create a lightweight technical wrapper around a repeated task.

Outputs:

- small harness design
- gates / checks
- one controlled execution example
- telemetry

Pass bar: the learner shows where the harness stops and why.

DEV-EX-05 — Working feature or service with green tests

Goal: create the Dev form of Customer Zero.

Outputs:

- working feature or service
- green test evidence
- Dev Book correction trail
- telemetry

Pass bar: the learner can demo the feature and explain at least one AI-generated mistake they corrected.

DEV-EX-o6 — Delegation Map + CI / gate thinking

Goal: decide which coding activities AI may do and where CI or human gates take over.

Outputs:

- delegation map
- L0-L5 labels
- A / A+ split
- gate list

Pass bar: sensitive changes, release-like actions, and high-impact code are not delegated past safe boundaries.

Dev capability map

Exercise	Capability emphasis
DEV-EX-01	Review discipline
DEV-EX-02	Test honesty
DEV-EX-03	Debug reasoning
DEV-EX-04	Safe automation
DEV-EX-05	Real build outcome
DEV-EX-06	CI and delegation control

Facilitator notes

- Fast code generation is not success by itself.
- Fake confidence from fake tests is one of the most dangerous dev-side failure modes.

- Review comments and fixes are stronger evidence than polished demo output.
- Telemetry is still part of the evaluation story.

Changelog

Version	Date	Update
v1.0	2026-07-02	First Dev track workbook
v2.0	2026-08-25	Header: shorten Program ref, add glossary pointer; move changelog to end
