

AIX FA 2026 — Pillar C: AI for People (draft plan)

Purpose: explain how the PM AI Bootcamp functions as the People pillar of the broader AIX plan for FA.

Relationship to the other pillars: Pillar C enables **Pillar A (AI for Delivery)** and **Pillar B (AI for Customer / revenue-facing work)**.

o. Why Pillar C is the foundation for A and B

Pillar C is not an isolated training effort. It is the mechanism that creates the operating capability needed for:

- better delivery margin through AI-enabled execution,
- better win rate through AI-enabled offerings and customer outcomes,
- a repeatable internal operating model.

Without people who can safely run AI-native work, the other pillars stay theoretical.

1. Goal and positioning

Pillar C aims to create a critical mass of PMs and adjacent roles who can:

- operate at **CASAN Level 2 (Augmented)** reliably,
- apply delegation, governance, telemetry, and ROI thinking,
- build and defend a real Customer Zero slice,
- act as the capability bridge into broader AIX work.

This pillar does **not** aim to create general AI enthusiasts. It aims to create **AI-native delivery operators**.

2. Audience and scale

Primary scope:

- **200-300 Project Managers**

Extension path:

- BA
- SA
- Dev

Delivery model:

- four role tracks sharing one common core,
- phased rollout by waves / cohorts,
- blended learning tied to real delivery work.

3. Program structure — about 9 weeks, 3 phases

Phase	Duration	Focus
1. AI Mindset	1 day	CASAN, AI-first mindset, L0-L5, operating principles
2. Hands-on	4 weeks	exercises and assignments across real project work
3. Capstone	4 weeks	build a Customer Zero slice, record Dev Book, defend in viva

The program is intentionally practical. Learners are not evaluated by slide knowledge or multiple-choice recall.

4. Core content and capabilities

The evaluation model uses six pillars:

1. AI Literacy
2. AI Delegation
3. Workflow Design
4. Governance and Risk
5. Telemetry and Economics
6. Outcome Leadership

Each pillar is scored on a 0-4 scale. Graduation requires:

- an average at or above the program threshold,
 - no pillar at zero,
 - a working system,
 - viva pass.
-

5. Operating model and governance

Pillar C teaches the same working model the AIX plan needs in practice:

- human-led, AI-first execution,
- Claude Code as the orchestrator,
- autonomy control through L0-L5 and leash A / A+,
- fail-closed gates,
- built-flagged waiting states,
- hard-stop on contradiction,
- evidence through Dev Book and telemetry.

This is important because the capability must be measurable and auditable, not merely motivational.

6. Project-based learning through six sample briefs

The training is not based only on a generic LMS example. It also uses a **six-brief project bank**, including:

- e-commerce storefront,
- clinic booking app,
- warehouse management,
- sales dashboard,
- loyalty app,
- AI contract summary feature.

This allows the program to:

- spread risk across multiple domains,
 - support different team backgrounds,
 - create comparable but realistic learning outputs.
-

7. Graduation and certification

Graduation requires three hard gates:

1. capability score,
2. working Customer Zero,
3. viva.

Recognition path:

- Certified
- Proficient
- Distinction
- Champion

The champion level is especially important because it seeds later waves and strengthens the self-reinforcing learning model.

8. Pillar C KPIs and their link to AIX business outcomes

Pillar C is measured by operational indicators such as:

- AI adoption
- compression
- review time
- rework rate
- estimation accuracy
- real telemetry completion
- Customer Zero completion rate

These indicators matter because they connect to:

- **Margin improvement** in Pillar A
- **Win-rate improvement** in Pillar B
- a more trustworthy AI operating model for FA overall

Pillar C is therefore not only "training output". It is a business enabler.

9. Remaining decisions needed to complete the 6-Ro framework

To finalize the Pillar C plan, FA still needs to lock:

- exact scope and naming of the FA unit context,
- baseline margin and win-rate numbers for attribution,
- rollout sequencing across cohorts and domains,
- governance and tool budget assumptions,
- reporting cadence and owner model.

Once these are fixed, Pillar C can be tied more tightly to the overall AIX roadmap and KPI tree.
